

Observations :

1. Early termination keeps convergence times consistent across network sizes
2. 3D Grid topology performs best for Gossip algorithm
3. Network size has minimal impact due to first-node convergence strategy
4. Both algorithms show similar performance characteristics

Observations :

Network size has a much greater impact on convergence time than strike count configuration.

The N-strike fault tolerance system adds minimal overhead regardless of strike threshold.

All network topologies maintain consistent performance scaling with perfect square node arrangements.
